

Vision Solutions. Easy. Affordable. Innovative.

“RecoverNow's simplicity allows much faster responses to everyday recovery requests that are critical for our users.”

Boone County, MO

RecoverNow™

Rapid Recovery of Single or Multiple Objects. “Rewind” Data with Push-Button Ease.

Tape backups are essential. But tapes don't fully protect your business from data loss. Recovering data from tapes can be slow, and even risky.

RecoverNow is the answer. RecoverNow automatically captures IBM i transaction and object changes that occur between tape saves, continuously saving them on storage devices you already have, including IBM i, AIX, Windows®, Linux®, HP/UX, or other UNIX® disks. It also makes recovering data faster and easier. Whether you need to rapidly recover a single damaged object or restore your entire system, RecoverNow enables you to bring back data and objects to near the point of failure, or to any point in time after your last tape save, using powerful Continuous Data Protection (CDP) capabilities.

Affordable Backup and Recovery that Protects Your Business

Are you still relying on tape backups as your Disaster Recovery plan? RecoverNow lets you recover more data than using tapes alone, potentially right up to the point of failure. Plus, **RecoverNow** can eliminate the downtime associated with tape saves, while providing potent CDP capabilities that enable you to rapidly recover recently corrupted or deleted data. And RecoverNow can easily use almost any storage system you already have as a powerful IBM i data backup device. Used alone or in addition to your existing HA solution, RecoverNow is the most affordable way to take your backup process to the next level or integrate it into a total recovery strategy.

Protect More Data, More Often

Relying entirely on tape backups is risky. If you ever need to recover your business using only nightly tape backups, you could lose up to a full day of data. In contrast, **RecoverNow** protects more of your data by leveraging and extending the capabilities of IBM i journaling. It captures data and object changes that occur between tape backups and continuously saves them to local or remote disk storage. And RecoverNow's extensive built-in journal management automation means that no journaling expertise is required.

Single Object Disaster? No Worries.

Using RecoverNow's CDP capabilities, you can recover data from any point back in time with just a few clicks, and without resorting to time consuming tape recovery. RecoverNow makes it fast and easy to recover single or multiple objects that become corrupted or are accidentally deleted, whether the problem occurred two hours ago or two days ago. Simple access to Save History means you can quickly drill down to the object or file you need to restore.

Data Backups Without Downtime

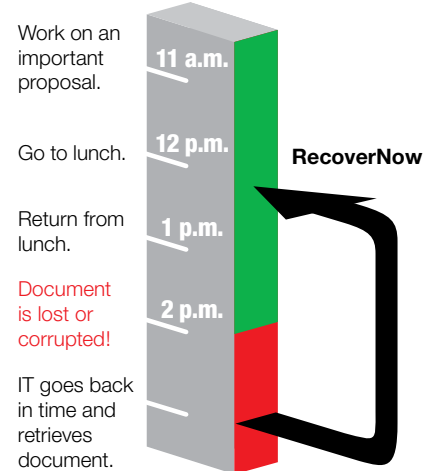

Downtime windows are often required to run traditional tape backups. That's a problem for 24/7 operations. But with RecoverNow, you don't have to choose between business uptime and data protection. RecoverNow lets you run your tape backups while users remain active. So you can achieve both productivity and protection.

RecoverNow. Rest Easy.

With **RecoverNow**, you can perform backups during the workday with no downtime. And, unlike tape-only solutions, you can restore individual files and objects, or your entire system, potentially right up to the point in time that the system failed. What does this mean for your business?

- Save time and money by rapidly recovering corrupted or accidentally deleted objects using RecoverNow's powerful CDP capabilities.
- Keep operations running 24/7 by eliminating the need for backup downtime windows.
- Ensure a more complete recovery from tapes and journals, should a disaster ever strike.
- Reduce the risk of recovery error using RecoverNow's automated restore process assistance. If a tape failure occurs, you are still protected. RecoverNow can complete a near-point-of-failure recovery even from an earlier tape set.
